Broad Spectrum Anthelmintic for Dogs and Cats
Drontal® Plus (praziquantel/pyrantel pamoate/febantel)
Taste Tabs

**CAUTION:** Federal (U.S.A.) law restricts this drug to use by or on the order of a licensed veterinarian.

**DESCRIPTION:** Drontal® Plus and Drontal® Plus Taste Tabs (praziquantel/pyrantel pamoate/febantel) Broad Spectrum Anthelmintic Tablets for Dogs are available in three tablet sizes. Each size is scored for convenience in oral administration.

Each Drontal® Plus and Drontal® Plus Taste Tabs Tablets for Puppies and Small Dogs contains 22.7 mg praziquantel, 22.7 mg pyrantel base as pyrantel pamoate and 113.4 mg febantel.

Each Drontal® Plus and Drontal® Plus Taste Tabs Tablets for Medium Sized Dogs contains 68.0 mg praziquantel, 68.0 mg pyrantel base as pyrantel pamoate and 340.2 mg febantel.

Each Drontal® Plus and Drontal® Plus Taste Tabs Tablets for Large Dogs contains 136.0 mg praziquantel, 136.0 mg pyrantel base as pyrantel pamoate, and 680.4 mg febantel.

**ACTION:** Drontal® Plus and Drontal® Plus Taste Tabs Tablets contain three active ingredients having different modes of action and spectra of activity. Praziquantel is active against cestodes (trematopes). Praziquantel is absorbed, metabolized in the liver and excreted in the bile. Upon entering the digestive tract from the bile, cystocidal activity is exhibited. Following oral administration of Drontal®, the tapeworm loses its ability to resist digestion by the mammalian host. Because of this, whole tapeworms, including the scolex, are very rarely observed. Ancylostoma caninum, Uncinaria stenocephala, Echinococcus granulosus, and Dracunculus medinensis are usually not observed in the stool. The majority of tapeworms are digested and are not found in the feces.

Pyrantel pamoate is active against hookworms and ascariids. Pyrantel pamoate acts on the cholinergic receptors in the intestine, leading to energy exchange breakdown and inhibited glucose uptake.

Febantel is active against nematode parasites including whipworms. Febantel is rapidly absorbed and distributed throughout the body. Metabolism of this compound occurs predominantly in the liver and excreted in the feces. The anthelmintic effects are observed using microscopic fecal examination procedures, are similar in appearance to those of common species such as Taenia solium.

**INDICATIONS:** Drontal® Plus (praziquantel/pyrantel pamoate/febantel) Broad Spectrum Anthelmintic Tablets and Drontal® Plus (praziquantel/pyrantel pamoate/febantel) Taste Tabs Broad Spectrum Chewable Anthelmintic Tablets are indicated for the treatment of tapeworms (Taenia crassiceps, T. serialis, Echinococcus granulosus, and Echinococcus multilocularis) and for removal of Echinococcus multilocularis and for removal of Hookworms (Ancylostoma caninum, Uncinaria stenocephala, Ascaris lumbricoides, Toxocara canis, Toxocara leonina, and Whipworms (Trichuris vulpis) in dogs.

**CONTRAINDICATIONS:** DO NOT USE IN PREGNANT ANIMALS. There are no known contraindications against the use of praziquantel or pyrantel pamoate in dogs.

**WARNINGS:** Strict hygienic precautions should be taken when handling dogs or feces suspected of harboring E. multilocularis. Infected dogs treated for the first time with Drontal® Plus and Drontal® Plus Taste Tabs Tablets and dogs treated at intervals greater than 28 days may shed eggs in the feces after treatment. The animal should be held in the clinic during this interval and all feces should be incinerated or autoclaved. If these procedures are not possible, the eggs can be destroyed by soaking the feces in a sodium hypochlorite (bleach) solution of 3.75% or greater. All areas where the animal was maintained or in contact with should be thoroughly cleaned with sodium hypochlorite and allowed to dry completely before reuse.
